EDUCATION

Sir M Visvesvaraya Institute of Technology, B.E. in Information Science
CGPA: 8.61

Sept 2023 – Jul 2027

TECHNICAL SKILLS

Languages: Java, JavaScript, Python, SQL

Frameworks & technologies: React, FastAPI, Node.js, Express.js, Flask, HTML, CSS

Databases & Tools: MySQL, PostgreSQL, Git, Kali Linux

Concepts: DSA, OOP, DBMS, OS, Computer Networks, SDLC, REST APIs

EXPERIENCE

Web Developer Intern

Jun 2026 – Jul 2026

InAmigos Foundation (NGO) - React, Node.js, JavaScript

- Improved the organization's website using React to enhance usability, functionality, and user experience.
- Developed an independent website prototype using React and Node.js to explore and showcase web design concepts.
- Analysed website functionality and identified areas for improvement, providing actionable recommendations.

PROJECTS

Enterprise Task & Workflow Management System

GitHub, Demo

- Built a full-stack web platform for team collaboration and project tracking with role-based access for Admin, Manager and Employee users
- Implemented JWT based authentication and RBAC to enforce role specific authorization across application modules.
- Integrated Socket.IO for real time task notifications and dashboard updates supporting concurrent users.
- Developed REST based backend services and integrated database operations for managing users, tasks and project workflows.
- Containerized and deployed the backend on Azure Container Apps and deployed the frontend on Vercel.

Tech Stack: MERN, Socket.IO, JWT, bcrypt, Vercel, Docker, Azure Container Apps

AttentionPay – Transaction fraud detection

GitHub, Demo

- Built and deployed a full-stack, two-stage payment-security platform using a FastAPI backend, PostgreSQL (SQLAlchemy) and a React (Vite) dashboard.
- Integrated a BERT phishing-URL classifier and a PyTorch TabTransformer fraud model behind REST APIs, with a feature-engineering pipeline and token-gated access between stages.
- Added deterministic security checks (API route integrity, impossible travel) that run before ML inference, so no single model decides the outcome. Transaction scenarios are served from PostgreSQL.
- Added SHAP/LIME explainability and showed the results in the React dashboard.
- Containerized the backend with Docker and set up CI/CD with GitHub Actions, Azure Container Registry and Azure Container Apps. The frontend is deployed on Vercel.

Tech Stack: FastAPI, React, PostgreSQL, PyTorch, Transformers, Docker, GitHub Actions, Azure Container Apps, Vercel

RiskLens — AI-Powered Risk Assessment Platform

GitHub

- Built a full-stack risk assessment platform (React, Flask, SQLAlchemy, MySQL) that turns project parameters into risk scores and mitigation recommendations.
- Trained a scikit-learn model for risk likelihood and impact and served it through Flask REST APIs. The React dashboard shows a risk index, heatmaps and severity breakdowns.
- Integrated GitHub and Jira APIs using OAuth and JWT authentication, and added Slack webhook alerts when the risk score crosses a configurable threshold.
- Containerized the application with Docker.

Tech Stack: React, Flask, MySQL, scikit-learn, REST APIs, OAuth, Docker
